When I build a project in Eclipse, I get a jar file in the out/ directory. I would like to create a regular jar file. How can I do it? A: You could do it from the command line using the jarsigner command. jarsigner -keystore ~/.keystore -alias myapp -digestalg SHA1 -keypass password -signedjar myapp.jar myapp.jar Where the keystore is the keystore used by the keychain on your computer. You can then change the file permissions of myapp.jar to allow access only to the user that created the jar: chmod 600 myapp.jar A: There is a dedicated plugin, but it's a PITA to use: You can make a runnable jar from within Eclipse. Select your project. Go to Build Path/Configure Build Path. Click on the tab "Export". Select "Java Build Path Entries" and "Export". Select a directory and give it a name. Select "Destination is a single file" and set it to your choice of a jar file. You're done. 1. Over the past century, several European countries have received thousands of refugees from countries with endemic leprosy. To assess the impact of the migration on the incidence of leprosy in the new countries of settlement, we conducted a prospective study of the prevalence of leprosy among some of the most recent European migrants. To date, the prevalence of leprosy in selected migrant groups in central Italy has been low (0.6%), whereas the prevalence of leprosy in subjects born in the leprosy-endemic countries of origin of the migrants was approximately 1% (range 0.9-3.5%). These results suggest that the migration of leprosy from endemic to non-endemic countries may substantially reduce the incidence of the disease in the new population.Atmospheric refractivity retrieval of aerosols from solar-backscattered lidar observations using a neural network.
