Command Line: The command-line features of AutoCAD require a command processor (run-time), a command interpreter (interpret-time), and a command-line (runtime) interpreter. When you start AutoCAD, it creates an environment for executing commands in AutoCAD, known as the command processor, as well as an environment for interpreting the command-line, the command interpreter. Each interpreter reads a command from the command-line and executes the command. There are three types of command-line interpreters: Subroutine interpreter: In this interpretation, AutoCAD looks at the current command and performs specific actions that affect the drawing. For example, you can specify the command type and then list the objects or commands that it affects. These objects and commands are the arguments of the command, which is passed through the command-line interpreter. In some cases, you can specify parameters to determine how the command is executed. Interpreter: In this interpretation, AutoCAD reads commands from the command-line interpreter. Routine interpreter: In this interpretation, AutoCAD looks at the current command and executes the command. You can control the interpreter behavior by using the /command-line option on the command line. For example, the following command-line interpreters give you different results: /c
