High-resolution electron tomography reveals the 3D structure of the membrane protein complex SRAM. The structure of the unusual protein-lipid complex of the signal-recognition particle (SR) of the bacteriophage T4 and the targeting membrane protein SRAM (part of the signal peptidase complex) was investigated at near-atomic resolution by electron tomography. The 3D maps of the membrane-spanning segment of the complex were determined directly from electron micrographs. The tomographic data were used to describe the structure of SRAM and to model and validate the structure of the complex. The SRAM model revealed unusual features of the three transmembrane helices, suggesting that SRAM adopts a double hairpin configuration. The apical part of
