This receiving apparatus includes a plurality of front-end circuits, each including a radio-frequency signal receiving circuit and a demodulator circuit that demodulates a received radio-frequency signal. The receiving apparatus performs a parallel/serial conversion process on a demodulated signal from each of the front-end circuits to perform parallel/serial conversion on the demodulated signal, and then sends the parallel/serial converted signal to a serial-to-parallel converter. A parallel signal to be used for a despreading process is output from the serial-to-parallel converter to a despreading circuit, and a parallel signal used for the despreading process is output to a despreading circuit in the next stage.Q: MySQL show fields that are not in result set Is there a way to show which fields are not in the result set of the query?
