Episodic and Semantic Memory Dysfunction in Adults With Psychogenic Vocal Dissonance and Healthy Controls: A Controlled Study. Psychogenic vocal dysphonia (PVD) causes significant impairment in functional communication. To date, the presence of brain-related differences in PVD has not been studied. The aim of this study was to assess episodic and semantic memory in adults with PVD and healthy controls. Eighty participants with PVD and 80 age- and sex-matched controls were recruited for the study. All participants completed a neuropsychological test battery consisting of a screening battery and 8 memory measures. The screening battery comprised the following instruments: the California Verbal Learning Test-Second Edition (CVLT-II), Rey-Osterrieth Complex Figure (ROCF), the Depression Anxiety and Stress Scale-21 (DASS-21), the Beck Anxiety Inventory (BAI), the Trail-Making Test (TMT), the Perceptual Speed Index of the Brief Attention Test (PST), the Digit Span of the Wechsler Adult Intelligence Scale (WAIS-III), the List Recall of the Rey Auditory Verbal Learning Test (RAVLT), and the Vocabulary Subtest of the WAIS-III. Furthermore, a brief neuropsychological test battery focusing on memory was administered. In the neuropsychological memory battery,

the CVLT-II, ROCF, the CVLT-II total learning index, and the RAVLT total learning index were assessed. The PVD group performed significantly worse on semantic memory, as measured with the ROCF, than controls. Our results point to a specific impairment of semantic memory in patients with PVD. This could have implications for the understanding of the path c6a93da74d
